

LARINOVA

Larinova Product Evaluation Handoff Note

Hospital review packet

Prepared for clinical, hospital administration, and hospital IT review

Larinova Product Evaluation Handoff Note

Date: 2026-05-06

Short Message

Larinova is ready to be evaluated as an OPD workflow product for doctors and clinics. The main review areas are:

1. Consultation workflow.
2. Real-time transcription and clinical note generation.
3. Prescription/document workflow.
4. Medical certificate generation.
5. Future hospital integration path.

What To Show First

1. Doctor dashboard.
2. Patient record.
3. Consultation recording/transcription.
4. Generated summary/prescription.
5. Medical certificate creation from patient record.
6. Hospital integration architecture document.

What To Say Clearly

- Larinova is not an anonymous certificate generator.
- Certificates are created inside the authenticated doctor workflow.
- Certificate output follows the expected Indian medical certificate structure more closely now: doctor registration, patient address, patient signature/thumb impression, identification mark, examination date/place, diagnosis/nature of illness, duration, doctor signature/seal area, and retained document record.
- HL7/HIS integration is not claimed as live yet. The architecture and phased pathway are ready for hospital discussion.

Questions for Evaluator

1. Does this OPD workflow match how doctors currently work?
2. Which part saves the most time: intake, transcription, prescription, certificate, or follow-up?
3. What certificate formats do hospitals/employers usually reject?
4. Does the hospital require digital signature, physical stamp, QR verification, or all three?
5. What integration route does the hospital prefer: REST API, webhooks, HL7, FHIR, or Mirth?

Known Next Product Work

- Add QR/verification page.
- Add doctor signature/seal upload.
- Add certificate finalization workflow.
- Add document share audit.
- Add hospital integration event schema.
